1   git-dotfiles: Store `$HOME` dot-files in Git

1.1   Activating git-dotiles To Manage Your `$HOME`

Check out the "bare" (.git directory) of **pjkundert/git-dotfiles** Git repo
to `~/.git-dotfiles`:

```
git checkout --bare git@github.com:pjkundert/git-dotfiles.git .git-dotfiles
```

To activate, first create the `git-dotfiles` alias, and configure it to not
show untracked files (the rest of the contents of your $HOME directory!):

```
alias git-dotfiles='git --git-dir=$HOME/.git-dotfiles --work-tree=$HOME'
git-dotfiles config --local status.showUntrackedFiles no
```

See how your current home directory's dot-files configuration compares:

```
git-dotfiles status
```

If this is a freshly created, you'll probably see that your home directory
is probably missing a bunch of `.alias`, `.bashrc`, ... files:

```
$ git-dotfiles status
On branch master
Changes to be committed:
  (use "git restore --staged <file>..." to unstage)
  deleted:    .alias
  deleted:    .bash_profile
...
```

So, if you're satisfied, just reset your home directory's dotfiles to the contents of the master branch's `HEAD`, to install all these files:

```
git-dotfiles reset --hard HEAD
```

Otherwise, if you have some custom content in some eg. .bashrc files that you want to integrate, you could `stash save` them, reset to the recommended baseline, and then `stash apply` your custom stuff onto the baseline:

```
git-dotfiles stash save
git-dotfiles reset --hard HEAD
git-dotfiles stash apply
```

1.2 Use $HOME/.bash_personal for Private Configurations

For API tokens, etc., put them in `.bash_personal`. This file will not be stored in the `git-dotfiles` Git repo.

2 Nix Enviroment via `nix-env`

Install Nix:

```
$ sh <(curl -L https://nixos.org/nix/install)
```

Use the `nix-env-update` alias to update your system to the current set of targets in `env.nix`.

A (partial) replacement for `homebrew` is provided by the `$HOME/env.nix` file. List any desired Nix targets here to have them added to your `$HOME/.nix-profile/bin`.

3 References

This implementation was derived from:

3.1 `https://atlassian.com/git/tutorials/dotfiles`

Provides a way to have a Git managed `$HOME` directory.

- Changed the `git` alias for accessing the Git repo to `git-dotfiles`

3.2 `https://checkoway.net/musings/nix`

Sensibly manage the Nix defaults used by `nix-env`, etc.

3.3 `https://nixos.org/manual/nixos/stable/#module-services-emacs`

Provision a specific version of Emacs and any modules required.

3.4 `https://nixos.wiki/wiki/TexLive`

Integrated this approach to provisioning texlive into `emacs.nix`.
